# Section 2.2

The Inverse of a Matrix

#### Definition

Let A be an  $n \times n$  square matrix. We say A is invertible (or nonsingular) if there is a matrix B of the same size, such that identity matrix

 $AB = I_n \quad \text{and} \quad BA = I_n$   $\begin{pmatrix} 1 & 0 & \cdots & 0 \\ 0 & 1 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & 1 \end{pmatrix}$ 

Example 
$$A = \begin{pmatrix} 2 & 1 \\ 1 & 1 \end{pmatrix}$$
  $B = \begin{pmatrix} 1 & -1 \\ -1 & 2 \end{pmatrix}$ .

Wild guess:  $B = A^{-1}$ . Check:

$$AB = \begin{pmatrix} 2 & 1 \\ 1 & 1 \end{pmatrix} \begin{pmatrix} 1 & -1 \\ -1 & 2 \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$$
$$BA = \begin{pmatrix} 1 & -1 \\ -1 & 2 \end{pmatrix} \begin{pmatrix} 2 & 1 \\ 1 & 1 \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}.$$

Definition

An elementary matrix is a matrix E that differs from  $I_n$  by one row operation.

There are three kinds, corresponding to the three elementary row operations:

scaling $(R_2 = 2R_2)$	row replacement $(R_2=R_2+2R_1)$	$(R_1 \longleftrightarrow R_2)$
$\begin{pmatrix} 1 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 1 \end{pmatrix}$	$\begin{pmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}$	$\begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix}$

Important Fact: For any  $n \times n$  matrix A, if E is the elementary matrix for a row operation, then EA differs from A by the same row operation.

Example:

$$\begin{pmatrix} 1 & 0 & 4 \\ 0 & 1 & 2 \\ 0 & -3 & -4 \end{pmatrix} \xrightarrow{R_2 = R_2 + 2R_1} \begin{pmatrix} 1 & 0 & 4 \\ 2 & 1 & 10 \\ 0 & -3 & -4 \end{pmatrix}$$
$$\begin{pmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 & 4 \\ 0 & 1 & 2 \\ 0 & -3 & -4 \end{pmatrix} = \begin{pmatrix} 1 & 0 & 4 \\ 2 & 1 & 10 \\ 0 & -3 & -4 \end{pmatrix}$$

Elementary matrices are invertible. The inverse is the elementary matrix which un-does the row operation.

$$R_{2} = R_{2} \times 2$$

$$\begin{pmatrix} 1 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 1 \end{pmatrix}^{-1} =$$

$$R_{2} = R_{2} + 2R_{1}$$

$$\begin{pmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}^{-1} =$$

$$R_{1} \longleftrightarrow R_{2}$$

$$\begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix}^{-1} =$$

$$R_{2} = R_{2} \div 2$$

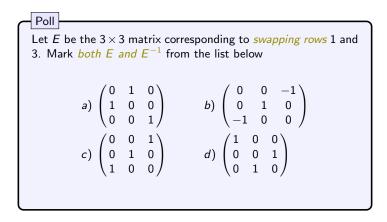

$$\begin{pmatrix} 1 & 0 & 0 \\ 0 & 1/2 & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

$$R_{2} = R_{2} - 2R_{1}$$

$$\begin{pmatrix} 1 & 0 & 0 \\ -2 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

$$R_{1} \longleftrightarrow R_{2}$$

$$\begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

Solution: Both *E* and 
$$E^{-1}$$
 are equal to  $\begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix}$ .

#### Solving Linear Systems via Inverses

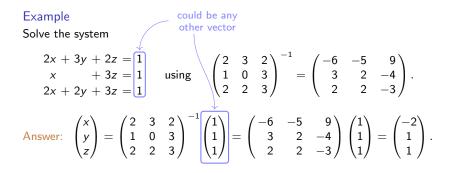

#### Theorem

If A is **invertible**, then for every b there is *unique solution* to Ax = b:

 $x = A^{-1}b.$ 

Verify: Multiple by A on the left!

$$Ax = AA^{-1}b = I_nb = b$$

# Computing $A^{-1}$

Let A be an  $n \times n$  matrix. Here's how to compute  $A^{-1}$ .

- 1. Row reduce the augmented matrix  $(A \mid I_n)$ .
- 2. If the result has the form  $(I_n | B)$ , then A is invertible and  $B = A^{-1}$ .
- 3. Otherwise, A is not invertible.

#### Example

$${f A}=egin{pmatrix} 1 & 0 & 4 \ 0 & 1 & 2 \ 0 & -3 & -4 \end{pmatrix}$$

Computing  $A^{-1}$ Example

$$\begin{pmatrix} 1 & 0 & 4 & | & 1 & 0 & 0 \\ 0 & 1 & 2 & | & 0 & 1 & 0 \\ 0 & -3 & -4 & | & 0 & 0 & 1 \end{pmatrix} \xrightarrow{R_3 = R_3 + 3R_2} \begin{pmatrix} 1 & 0 & 4 & | & 1 & 0 & 0 \\ 0 & 1 & 2 & | & 0 & 1 & 0 \\ 0 & 0 & 2 & | & 0 & 3 & 1 \end{pmatrix}$$
$$\xrightarrow{R_1 = R_1 - 2R_3} \begin{array}{c} R_2 = R_2 - R_3 \\ R_2 = R_2 - R_3 \\ R_3 = R_3 \div 2 \\ 0 & 0 & 2 & | & 0 & 3 & 1 \end{pmatrix}$$
$$\xrightarrow{R_3 = R_3 \div 2} \begin{pmatrix} 1 & 0 & 0 & | & 1 & -6 & -2 \\ 0 & 1 & 0 & | & 0 & -2 & -1 \\ 0 & 0 & 2 & | & 0 & 3 & 1 \end{pmatrix}$$
$$\xrightarrow{R_3 = R_3 \div 2} \begin{array}{c} 1 & 0 & 0 & | & 1 & -6 & -2 \\ 0 & 1 & 0 & | & 0 & -2 & -1 \\ 0 & 0 & 1 & | & 0 & 3/2 & 1/2 \end{pmatrix}$$
So  $\begin{pmatrix} 1 & 0 & 4 \\ 0 & 1 & 2 \\ 0 & -3 & -4 \end{pmatrix}^{-1} = \begin{pmatrix} 1 & -6 & -2 \\ 0 & -2 & -1 \\ 0 & 3/2 & 1/2 \end{pmatrix}$ .
$$\begin{pmatrix} 1 & 0 & 4 \\ 0 & 1 & 2 \\ 0 & -3 & -4 \end{pmatrix} \begin{pmatrix} 1 & -6 & -2 \\ 0 & -2 & -1 \\ 0 & 3/2 & 1/2 \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \checkmark$$

### Why Does This Work?

First answer: We can think of the algorithm as *simultaneously solving* the equations

$$Ax_{1} = e_{1}: \qquad \begin{pmatrix} 1 & 0 & 4 & | & 1 & 0 & 0 \\ 0 & 1 & 2 & | & 0 & 1 & 0 \\ 0 & -3 & -4 & | & 0 & 0 & 1 \end{pmatrix}$$
$$Ax_{2} = e_{2}: \qquad \begin{pmatrix} 1 & 0 & 4 & | & 1 & 0 & 0 \\ 0 & 1 & 2 & | & 0 & 1 & 0 \\ 0 & -3 & -4 & | & 0 & 0 & 1 \end{pmatrix}$$
$$Ax_{3} = e_{3}: \qquad \begin{pmatrix} 1 & 0 & 4 & | & 1 & 0 & 0 \\ 0 & 1 & 2 & | & 0 & 1 & 0 \\ 0 & -3 & -4 & | & 0 & 0 & 1 \end{pmatrix}$$

From theory:  $x_i = A^{-1}Ax_i = A^{-1}e_i$ . So  $x_i$  is the *i*-th column of  $A^{-1}$ .

Row reduction: the solution x<sub>i</sub> appears in *i*-th column in the augmented part.

Second answer: Through *elementary matrices*, see extra material at the end.

## The $2 \times 2$ case

Let 
$$A = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$$
. The **determinant** of A is the number  
 $det(A) = det \begin{pmatrix} a & b \\ c & d \end{pmatrix} = ad - bc.$ 

A is invertible only when 
$$det(A) \neq 0$$
, and  
$$A^{-1} = \frac{1}{det(A)} \begin{pmatrix} d & -b \\ -c & a \end{pmatrix}.$$

We can **get the identity** only when  $ad - bc \neq 0$ . Verify:

$$\begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} d & -b \\ -c & a \end{pmatrix} = \begin{pmatrix} ad - bc & 0 \\ 0 & ad - bc \end{pmatrix} = \begin{pmatrix} d & -b \\ -c & a \end{pmatrix} \begin{pmatrix} a & b \\ c & d \end{pmatrix}$$

### Example

$$\det \begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix} = 1 \cdot 4 - 2 \cdot 3 = -2 \qquad \begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}^{-1} = -\frac{1}{2} \begin{pmatrix} 4 & -2 \\ -3 & 1 \end{pmatrix}.$$

-

#### **Useful Facts**

Suppose A, B and C are invertible  $n \times n$  matrices.

- 1.  $A^{-1}$  is invertible and its inverse is  $(A^{-1})^{-1} = A$ .
- 2.  $A^{T}$  is invertible and  $(A^{T})^{-1} = (A^{-1})^{T}$ .

Important: AB is invertible and its inverse is  $(AB)^{-1} = A^{-1}B^{-1}B^{-1}A^{-1}$ .

Why?  $(B^{-1}A^{-1})AB = B^{-1}(A^{-1}A)B = B^{-1}I_nB = B^{-1}B = I_n.$ Similarly,  $(ABC)^{-1} = C^{-1}B^{-1}A^{-1}$ 

$$(ABC)(C^{-1}B^{-1}A^{-1}) = AB(CC^{-1})B^{-1}A^{-1} = A(BB^{-1})A^{-1} = AA^{-1} = I_n.$$

In general The product of invertible matrices is invertible. The *inverse is the product* of the inverses, in the *reverse order*.

#### Theorem

An  $n \times n$  matrix A is invertible if and only if it is row equivalent to  $I_n$ .

Why? Say the row operations taking A to  $I_n$  are the elementary matrices  $E_1, E_2, \ldots, E_k$ . So

pay attention to the order!  $\longrightarrow E_k E_{k-1} \cdots E_2 E_1 A = I_n$  $\implies E_k E_{k-1} \cdots E_2 E_1 A A^{-1} = A^{-1}$  $\implies E_k E_{k-1} \cdots E_2 E_1 I_n = A^{-1}.$ 

This is what we do when row reducing the augmented matrix: *Do same row operations* to *A* (first line above) and to  $I_n$  (last line above). Therefore, you'll end up with  $I_n$  and  $A^{-1}$ .

$$(A \mid I_n) \dashrightarrow (I_n \mid A^{-1})$$
