## Announcements

Wednesday, October 11
$\triangleright$ Quiz this Friday covers sections 2.1,2.2 and 2.3
$\triangleright$ Midterm next Friday October 20th:

- covers all material through Section 2.9
- type of questions from Sections 1.7 through 2.9

## Section 2.8

Subspaces of $\mathbf{R}^{n}$

## Subspaces: Motivation and examples

## Example

The subset $\{0\}$ : this subspace contains only one vector.
Example
A line $L$ through the origin:
this contains the span of any vector in
L.

Example
A plane $P$ through the origin:
this contains the span of any two vectors in $P$.

Example
All of $\mathbf{R}^{n}$ :
this contains 0 , and is closed under addition and scalar multiplication.

- The span was our first example of subspace: $\operatorname{Span}\left\{v_{1}, \ldots, v_{p}\right\}$.
- But in general, subspaces are not defined by 'the generating vectors'

## Subsets vs. Subspaces

A subset of $\mathbf{R}^{n}$ is any collection of vectors whatsoever. All non-examples of subspaces will be still subsets of $\mathbf{R}^{n}$.

Subset: yes
Subspace: no

A subspace is a special kind of subset, which satisfies three defining properties:

1. "not empty"
2. "closed under addition"
3. "closed under $\times$ scalars"

## Non-Examples

Color code
Purple: wanna-be 'subspaces'
Red vectors: would have to be in the subset too.

Non-Example
Any set that doesn't contain the origin
Fails condition (1).

Non-Example
The first quadrant in $\mathbf{R}^{2}$.
Fails close under $\times$ scalar only.

Non-Example
A line union a plane in $\mathbf{R}^{3}$.
Fails close under addition only.

## The Definition of Subspace

## Definition

A subspace of $\mathbf{R}^{n}$ is a subset $V$ of $\mathbf{R}^{n}$ satisfying:

1. The zero vector is in $V$. "not empty"
2. If $u$ and $v$ are in $V$, then $u+v$ is also in $V$.
3. If $u$ is in $V$ and $c$ is in $\mathbf{R}$, then $c u$ is in $V$.
"closed under addition"
"closed under $\times$ scalars"

Consequences of definition:

- By (3), if $v$ is in $V$, then so is the line through $v$.
- By (2),(3), if $u, v$ are in $V$, then so is $x u+y v$, for all $x, y \in \mathbf{R}$.

$$
\text { A subspace } V \text { contains the span of any set of vectors in } V \text {. }
$$

## Spans are Subspaces

## Theorem

Any $\operatorname{Span}\left\{v_{1}, v_{2}, \ldots, v_{n}\right\}$ is a subspace.

## Check:

1. $0=0 v_{1}+0 v_{2}+\cdots+0 v_{n}$ is in the span.
2. If, say, $u=3 v_{1}+4 v_{2}$ and $v=-v_{1}-2 v_{2}$, then

$$
u+v=3 v_{1}+4 v_{2}-v_{1}-2 v_{2}=2 v_{1}+2 v_{2}
$$

is also in the span.
3. Similarly, if $u$ is in the span, then so is $c u$ for any scalar $c$.

## Definition

If $V=\operatorname{Span}\left\{v_{1}, v_{2}, \ldots, v_{n}\right\}$, we say that $V$ is the subspace generated by or spanned by the vectors $v_{1}, v_{2}, \ldots, v_{n}$.

## !!!

Every span is a subspace but also every subspace is a span.
How would you find the generating vectors?

## Poll

## Poll

Why is the first quadrant of $\mathbf{R}^{2}$ not a subspace? Which property(ies) does it fail?

$$
Q=\left\{\binom{a_{1}}{a_{2}}: a_{1} \geq 0, a_{2} \geq 0\right\}
$$

1. The zero vector is contained in the first quadrant:
2. It is closed under addition: $\binom{a_{1}}{a_{2}},\binom{b_{1}}{b_{2}} \in Q$ then

$$
a_{1}+b_{1} \geq 0 \quad a_{2}+b_{2} \geq 0 \Rightarrow\binom{a_{1}+b_{1}}{a_{2}+b_{2}} \in Q
$$

3. It is not closed under $\times$ scalar: let $a_{1}, a_{2}>0$ and $c<0$ then

$$
c \cdot a_{1}<0 \quad c \cdot a_{2}<0 \Rightarrow\binom{a_{1}}{a_{2}} \in Q, \quad c\binom{a_{1}}{a_{2}} \notin Q
$$

## Subspaces

Verification
Let $V=\left\{\binom{a}{b}\right.$ in $\left.\mathbf{R}^{2} \mid a b=0\right\}$. Let's check if $V$ is a subspace or not.

1. Does $V$ contain the zero vector? $\binom{a}{b}=\binom{0}{0} \Longrightarrow a b=0$
2. Is $V$ closed under scalar multiplication?

- Let $\binom{a}{b}$ be in $V$. ( $a$ and $b$ such that $a b=0$ ). Let $c$ be a scalar.
- Is $c\binom{a}{b}=\binom{c a}{c b}$ in $V$ ?

Yes, since $(c a)(c b)=c^{2}(a b)=c^{2}(0)=0$
2. Is $V$ closed under addition?

- Let $\binom{a}{b}$ and $\binom{a^{\prime}}{b^{\prime}}$ be in $V .\left(a b=0\right.$ and $\left.a^{\prime} b^{\prime}=0\right)$.

- Is $\binom{a}{b}+\binom{a^{\prime}}{b^{\prime}}=\binom{a+a^{\prime}}{b+b^{\prime}}$ in $V$ ?
- Need to have $\left(a+a^{\prime}\right)\left(b+b^{\prime}\right)=0$ always. However, for $a=b^{\prime}=0$ and $a^{\prime}=b=1$ this is not true.
- $\binom{1}{0},\binom{0}{1}$ are in $V$, but $\binom{1}{1}$ is not in $V,(1 \cdot 1 \neq 0)$.

We conclude that $V$ is not a subspace. A picture is above.

## Basis and dimension of a Subspace

Let $V$ be a subspace of $\mathbf{R}^{n}$ and $\left\{v_{1}, v_{2}, \ldots, v_{m}\right\}$ in $V$ linearly independent. So that every time you 'add one' of these vectors, the span gets bigger.

$$
\text { What if } \operatorname{Span}\left\{v_{1}, \ldots, v_{m}\right\}=V \text { ? }
$$

Then any smaller set can't span $V$. If we remove any vector, the span gets smaller:

## Definition

Let $V$ be a subspace of $\mathbf{R}^{n}$. A basis of $V$ is a set of vectors $\left\{v_{1}, v_{2}, \ldots, v_{m}\right\}$ in $V$ such that:

1. $V=\operatorname{Span}\left\{v_{1}, v_{2}, \ldots, v_{m}\right\}$, and
2. $\left\{v_{1}, v_{2}, \ldots, v_{m}\right\}$ is linearly independent.

The number of vectors in a basis is the dimension of $V$, and is written $\operatorname{dim} V$.

## Important

A subspace has many different bases, but they all have the same number of vectors (see the exercises in §2.9).

## Bases of $\mathbf{R}^{2}$

## Question

What is a basis for $\mathbf{R}^{2}$ ?
We need two vectors that span $\mathbf{R}^{2}$ and are linearly independent. $\left\{e_{1}, e_{2}\right\}$ is one basis.

1. They span: $\binom{a}{b}=a e_{1}+b e_{2}$.
2. They are linearly independent.

## Question

What is another basis for $\mathbf{R}^{2}$ ?
Any two nonzero vectors that are not collinear. $\left\{\binom{1}{0},\binom{1}{1}\right\}$ is also a basis.

1. They span: $\left(\begin{array}{ll}1 & 1 \\ 0 & 1\end{array}\right)$ has a pivot in every row.
2. They are linearly independent: $\left(\begin{array}{ll}1 & 1 \\ 0 & 1\end{array}\right)$ has a pivot in every column.

## Bases of $\mathbf{R}^{n}$

The unit coordinate vectors

$$
e_{1}=\left(\begin{array}{c}
1 \\
0 \\
\vdots \\
0 \\
0
\end{array}\right), \quad e_{2}=\left(\begin{array}{c}
0 \\
1 \\
\vdots \\
0 \\
0
\end{array}\right), \quad \ldots, \quad e_{n-1}=\left(\begin{array}{c}
0 \\
0 \\
\vdots \\
1 \\
0
\end{array}\right), \quad e_{n}=\left(\begin{array}{c}
0 \\
0 \\
\vdots \\
0 \\
1
\end{array}\right)
$$

are a basis for $\mathbf{R}^{n}$ $\qquad$ The identity matrix has columns $e_{1}, e_{2}, \ldots, e_{n}$.

1. They span: $I_{n}$ has a pivot in every row.
2. They are linearly independent: $I_{n}$ has a pivot in every column.

In general:
$\left\{v_{1}, v_{2}, \ldots, v_{n}\right\}$ is a basis for $\mathbf{R}^{n}$ if and only if the matrix

$$
A=\left(\begin{array}{cccc}
\mid & \mid & & \mid \\
v_{1} & v_{2} & \cdots & v_{n} \\
\mid & \mid & & \mid
\end{array}\right)
$$

has a pivot in every row and every column, i.e. if $A$ is invertible.

## Basis of a Subspace

## Example

## Example

Let

$$
V=\left\{\left(\begin{array}{l}
x \\
y \\
z
\end{array}\right) \text { in } \mathbf{R}^{3} \mid x+3 y+z=0\right\} \quad \mathcal{B}=\left\{\left(\begin{array}{c}
-3 \\
1 \\
0
\end{array}\right),\left(\begin{array}{c}
0 \\
1 \\
-3
\end{array}\right)\right\}
$$

Verify that $\mathcal{B}$ is a basis for $V$.
0 . In $V$ : both vectors satisfy the equation, so are in $V$

$$
-3+3(1)+0=0 \quad \text { and } \quad 0+3(1)+(-3)=0
$$

1. Span: If $\left(\begin{array}{l}x \\ y \\ z\end{array}\right)$ is in $V$, then $y=-\frac{1}{3}(x+z)$, so

$$
\left(\begin{array}{l}
x \\
y \\
z
\end{array}\right)=-\frac{x}{3}\left(\begin{array}{c}
-3 \\
1 \\
0
\end{array}\right)-\frac{z}{3}\left(\begin{array}{c}
0 \\
1 \\
-3
\end{array}\right)
$$

## 2. Linearly independent:

$$
c_{1}\left(\begin{array}{c}
-3 \\
1 \\
0
\end{array}\right)+c_{2}\left(\begin{array}{c}
0 \\
1 \\
-3
\end{array}\right)=0 \Longrightarrow\left(\begin{array}{c}
-3 c_{1} \\
c_{1}+c_{2} \\
-3 c_{2}
\end{array}\right)=\left(\begin{array}{l}
0 \\
0 \\
0
\end{array}\right) \Longrightarrow c_{1}=c_{2}=0
$$

## Subspaces of a transformation

An $m \times n$ matrix $A$ naturally gives rise to two subspaces.

## Definition

The column space of $A$ is the subspace of $\mathbf{R}^{m}$ spanned by the columns of A. It is written $\operatorname{Col} A$.

The null space of $A$ is a subspace of $\mathbf{R}^{n}$ containing the set of all solutions of the homogeneous equation $A x=0$ :

$$
\operatorname{Nul} A=\left\{x \text { in } \mathbf{R}^{n} \mid A x=0\right\}
$$

## Some remarks:

- The column space is the range (as opposed to the codomain) of the transformation $T(x)=A x$.
- The column space is defined as a span, so we know it is a subspace.
- For the null space is easier to verify it is a subspace than find its generators. (This is one reason subspaces are so useful.)

## Column Space and Null Space

## Example

Let $A=\left(\begin{array}{ll}1 & 1 \\ 1 & 1 \\ 1 & 1\end{array}\right)$.
Let's compute the column space:

$$
\operatorname{Col} A=\operatorname{Span}\left\{\left(\begin{array}{l}
1 \\
1 \\
1
\end{array}\right),\left(\begin{array}{l}
1 \\
1 \\
1
\end{array}\right)\right\}=\operatorname{Span}\left\{\left(\begin{array}{l}
1 \\
1 \\
1
\end{array}\right)\right\}
$$

This is a line in $\mathrm{R}^{3}$.
Let's compute the null space:

$$
A\binom{x}{y}=\left(\begin{array}{l}
x+y \\
x+y \\
x+y
\end{array}\right)
$$

This zero if and only if $x=-y$. So

$$
\operatorname{Nul} A=\left\{\binom{x}{y} \text { in } \mathbf{R}^{2} \mid y=-x\right\} .
$$

This defines a line in $\mathbf{R}^{2}$ :

## Verify: The null space is a subspace and a span

Check that the null space is a subspace:

1. 0 is in Nul $A$ because $A 0=0$.
2. If $u$ and $v$ are in $\operatorname{Nul} A$, then $A u=0$ and $A v=0$. Hence

$$
A(u+v)=A u+A v=0
$$

so $u+v$ is in $\operatorname{Nul} A$.
3. If $u$ is in $\operatorname{Nul} A$, then $A u=0$. For any scalar $c, A(c u)=c A u=0$. So $c u$ is in Nul $A$.

## Question

How to find vectors which span the null space? Answer: Parametric vector form!
We know that the solution set to $A x=0$ has a parametric form that looks like
$x_{3}\left(\begin{array}{l}1 \\ 2 \\ 1 \\ 0\end{array}\right)+x_{4}\left(\begin{array}{c}-2 \\ 3 \\ 0 \\ 1\end{array}\right) \quad \begin{gathered}\text { if, say, } x_{3} \text { and } x_{4} \\ \text { are the free } \\ \text { variables. So }\end{gathered} \quad$ Nul $A=\operatorname{Span}\left\{\left(\begin{array}{l}1 \\ 2 \\ 1 \\ 0\end{array}\right),\left(\begin{array}{c}-2 \\ 3 \\ 0 \\ 1\end{array}\right)\right\}$.
Refer back to the slides for $\S 1.5$ (Solution Sets).

## Find Null Space as a Span

## Example

Find vector(s) that span the null space of $A=\left(\begin{array}{ll}1 & 1 \\ 1 & 1 \\ 1 & 1\end{array}\right)$.
The reduced row echelon form is $\left(\begin{array}{ll}1 & 1 \\ 0 & 0 \\ 0 & 0\end{array}\right)$.
This gives the equation $x+y=0$, or

$$
\begin{aligned}
& x=-y \\
& y=y
\end{aligned} \quad \begin{gathered}
\text { parametric vector form } \\
y m m m m m m m m u m u m u m u m ~
\end{gathered} \quad\binom{x}{y}=y\binom{-1}{1} .
$$

The null space is

$$
\operatorname{Nul} A=\operatorname{Span}\left\{\binom{-1}{1}\right\} .
$$

## Basis for $\operatorname{Nul} A$

## Fact

The vectors in the parametric vector form of the general solution to $A x=0$ always form a basis for $\mathrm{Nul} A$.

Example

$$
A=\left(\begin{array}{rrrr}
1 & 2 & 0 & -1 \\
-2 & -3 & 4 & 5 \\
2 & 4 & 0 & -2
\end{array}\right) \quad \stackrel{\text { rref }}{\stackrel{\text { ren }}{ }}\left(\begin{array}{rrrr}
1 & 0 & -8 & -7 \\
0 & 1 & 4 & 3 \\
0 & 0 & 0 & 0
\end{array}\right)
$$

$$
\underset{\substack{\text { parametric } \\
\text { vector } \\
\text { form } \\
\text { mimma }}}{ } x=x_{3}\left(\begin{array}{c}
8 \\
-4 \\
1 \\
0
\end{array}\right)+x_{4}\left(\begin{array}{c}
7 \\
-3 \\
0 \\
1
\end{array}\right) \xrightarrow{\substack{\text { basis of } \\
\text { NulA } A \\
\text { mman }}}\left\{\left(\begin{array}{c}
8 \\
-4 \\
1 \\
0
\end{array}\right),\left(\begin{array}{c}
7 \\
-3 \\
0 \\
1
\end{array}\right)\right\}
$$

1. The vectors span $\operatorname{Nul} A$ by construction (every solution to $A x=0$ has this form).
2. Can you see why they are linearly independent? (Look at the last two rows.)

## Basis for $\operatorname{Col} A$

## Fact

The pivot columns of $A$ always form a basis for $\operatorname{Col} A$.

Warning: It is the pivot columns of the original matrix $A$, not the row-reduced form. (Row reduction changes the column space.)
Example

$$
A=\left(\begin{array}{rrrr}
1 \\
-2 & - & \left.\begin{array}{rrr}
2 & 0 & -1 \\
2 & 4 & 5 \\
4 & 0 & -2
\end{array}\right) \quad \underset{\sim}{\text { rref }}\left(\begin{array}{rrrr}
1 & 0 & -8 & -7 \\
0 & 1 & 4 & 3 \\
0 & 0 & 0 & 0
\end{array}\right) .
\end{array}\right.
$$

$$
\text { pivot columns }=\text { basis } \text { «mmunn pivot columns in rref }
$$

So a basis for $\operatorname{Col} A$ is

$$
\left\{\left(\begin{array}{r}
1 \\
-2 \\
2
\end{array}\right),\left(\begin{array}{r}
2 \\
-3 \\
4
\end{array}\right)\right\}
$$

Why? End of $\S 2.8$, or ask in office hours.

## Subspaces

Summary

How do you check if a subset is a subspace?

- Is it a span?
- Is it all of $\mathbf{R}^{n}$ or the zero subspace $\{0\}$ ?

## Can it be written as

- a span?
- the column space of a matrix?
- the null space of a matrix?
- a type of subspace that we'll learn about later (eigenspaces, ... )?

If so, then it's automatically a subspace.
If all else fails:

- Can you verify directly that it satisfies the three defining properties?
