## MATH 1553 <br> SAMPLE MIDTERM 1: THROUGH 1.5

| Name | Section |  |
| :--- | :--- | :--- | :--- |

| 1 | 2 | 3 | 4 | 5 | Total |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |  |

Please read all instructions carefully before beginning.

- Each problem is worth 10 points. The maximum score on this exam is 50 points.
- You have 50 minutes to complete this exam.
- There are no aids of any kind (notes, text, etc.) allowed.
- Please show your work.
- You may cite any theorem proved in class or in the sections we covered in the text.
- Good luck!

This is a practice exam. It is similar in format, length, and difficulty to the real exam. It is not meant as a comprehensive list of study problems. I recommend completing the practice exam in 50 minutes, without notes or distractions.

In this problem, $A$ is an $m \times n$ matrix ( $m$ rows and $n$ columns) and $b$ is a vector in $\mathbf{R}^{m}$. Circle $\mathbf{T}$ if the statement is always true (for any choices of $A$ and $b$ ) and circle F otherwise. Do not assume anything else about $A$ or $b$ except what is stated.
a) $\mathbf{T} \quad \mathbf{F}$ The matrix below is in reduced row echelon form.

$$
\left(\begin{array}{rrrr|r}
1 & 1 & 0 & -3 & 1 \\
0 & 0 & 1 & -1 & 5 \\
0 & 0 & 0 & 0 & 0
\end{array}\right)
$$

b) $\quad \mathbf{T} \quad \mathbf{F} \quad$ If $A$ has fewer than $n$ pivots, then $A x=b$ has infinitely many solutions.
c) $\mathbf{T} \quad \mathbf{F} \quad$ If the columns of $A$ span $\mathbf{R}^{m}$, then $A x=b$ must be consistent.
d) $\mathbf{T} \quad \mathbf{F}$ If $A x=b$ is consistent, then the equation $A x=5 b$ is consistent.
e) $\mathbf{T} \quad \mathbf{F}$ If $A x=b$ is consistent, then the solution set is a span.

## Solution.

a) True.
b) False: For example, $\left(\begin{array}{ll}1 & 0 \\ 0 & 0\end{array}\right)\binom{x_{1}}{x_{2}}=\binom{0}{1}$ has one pivot but has no solutions.
c) True: the span of the columns of $A$ is exactly the set of all $v$ for which $A x=v$ is consistent. Since the span is $\mathbf{R}^{m}$, the matrix equation is consistent no matter what $b$ is.
d) True: If $A w=b$ then $A(5 w)=5 A w=5 b$.
e) False: it is a translate of a span (unless $b=0$ ).

Acme Widgets, Gizmos, and Doodads has two factories. Factory A makes 10 widgets, 3 gizmos, and 2 doodads every hour, and factory B makes 4 widgets, 1 gizmo, and 1 doodad every hour.
a) If factory A runs for $a$ hours and factory $B$ runs for $b$ hours, how many widgets, gizmos, and doodads are produced? Express your answer as a vector equation.
b) A customer places an order for 16 widgets, 5 gizmos, and 3 doodads. Can Acme fill the order with no widgets, gizmos, or doodads left over? If so, how many hours do the factories run? If not, why not?

## Solution.

a) Let $w, g$, and $d$ be the number of widgets, gizmos, and doodads produced.

$$
\left(\begin{array}{l}
w \\
g \\
d
\end{array}\right)=a\left(\begin{array}{c}
10 \\
3 \\
2
\end{array}\right)+b\left(\begin{array}{l}
4 \\
1 \\
1
\end{array}\right) .
$$

b) We need to solve the vector equation

$$
\left(\begin{array}{c}
16 \\
5 \\
3
\end{array}\right)=a\left(\begin{array}{c}
10 \\
3 \\
2
\end{array}\right)+b\left(\begin{array}{l}
4 \\
1 \\
1
\end{array}\right) .
$$

We put it into an augmented matrix and row reduce:

$$
\begin{aligned}
& \left(\begin{array}{rr|r}
10 & 4 & 16 \\
3 & 1 & 5 \\
2 & 1 & 3
\end{array}\right) \text { mant }\left(\begin{array}{rr|r}
3 & 1 & 5 \\
2 & 1 & 3 \\
10 & 4 & 16
\end{array}\right) \text { man }\left(\begin{array}{rr|r}
1 & 0 & 2 \\
2 & 1 & 3 \\
10 & 4 & 16
\end{array}\right) \text { man }\left(\begin{array}{rr|r}
1 & 0 & 2 \\
0 & 1 & -1 \\
10 & 4 & 16
\end{array}\right) \\
& \text { man } \rightarrow\left(\begin{array}{rr|r}
1 & 0 & 2 \\
0 & 1 & -1 \\
0 & 0 & 0
\end{array}\right)
\end{aligned}
$$

These equations are consistent, but they tell us that factory B would have to run for -1 hours! Therefore it can't be done.

## Problem 3.

Consider the system below, where $h$ and $k$ are real numbers.

$$
\begin{gathered}
x+3 y=2 \\
3 x-h y=k .
\end{gathered}
$$

a) Find the values of $h$ and $k$ which make the system inconsistent.
b) Find the values of $h$ and $k$ which give the system a unique solution.
c) Find the values of $h$ and $k$ which give the system infinitely many solutions.

## Solution.

We form an augmented matrix and row-reduce.

$$
\left(\begin{array}{rr|r}
1 & 3 & 2 \\
3 & -h & k
\end{array}\right) \xrightarrow{R_{2}=R_{2}-3 R_{1}}\left(\begin{array}{rr|r}
1 & 3 & 2 \\
0 & -h-9 & k-6
\end{array}\right)
$$

a) The system is inconsistent precisely when the augmented matrix has a pivot in the rightmost column. This is when $-h-9=0$ and $k-6 \neq 0$, so $h=-9$ and $k \neq 6$.
b) The system has a unique solution if and only if the left two columns are pivot columns. We know the first column has a pivot, and the second column has a pivot precisely when $-h-9 \neq 0$, so $h \neq-9$ and $k$ can be any real number .
c) The system has infinitely many solutions when the system is consistent and has a free variable (which in this case must be $y$ ), so $-h-9=0$ and $k-6=0$, hence $h=-9$ and $k=6$.

Consider the following consistent system of linear equations.

$$
\begin{array}{r}
x_{1}+2 x_{2}+3 x_{3}+4 x_{4}=-2 \\
3 x_{1}+4 x_{2}+5 x_{3}+6 x_{4}=-2 \\
5 x_{1}+6 x_{2}+7 x_{3}+8 x_{4}=-2
\end{array}
$$

a) [4 points] Find the parametric vector form for the general solution.
b) [3 points] Find the parametric vector form of the corresponding homogeneous equations.
c) [3 points] Unrelated to parts (a) and (b).

If $b, v, w$ are vectors in $\mathbf{R}^{3}$ and $\operatorname{Span}\{b, v, w\}=\mathbf{R}^{3}$, is it possible that $b$ is in Span $\{v, w\}$ ? Fully justify your answer.

## Solution.

a) We put the equations into an augmented matrix and row reduce:

$$
\begin{gathered}
\left(\begin{array}{rrrr|r}
1 & 2 & 3 & 4 & -2 \\
3 & 4 & 5 & 6 & -2 \\
5 & 6 & 7 & 8 & -2
\end{array}\right) \underset{\sim m u r}{ }\left(\begin{array}{rrrr|r}
1 & 2 & 3 & 4 & -2 \\
0 & -2 & -4 & -6 & 4 \\
0 & -4 & -8 & -12 & 8
\end{array}\right) \underset{\sim m u r}{ }\left(\begin{array}{llll|r}
1 & 2 & 3 & 4 & -2 \\
0 & 1 & 2 & 3 & -2 \\
0 & 0 & 0 & 0 & 0
\end{array}\right) \\
\left.\underset{\text { munt }}{ } \begin{array}{rrrrrr}
1 & 0 & -1 & -2 & 2 \\
0 & 1 & 2 & 3 & -2 \\
0 & 0 & 0 & 0 & 0
\end{array}\right)
\end{gathered}
$$

This means $x_{3}$ and $x_{4}$ are free, and the general solution is

$$
x_{1} \begin{aligned}
& -x_{3}-2 x_{4}=2 \\
& x_{2}+2 x_{3}+3 x_{4}=-2
\end{aligned} \Longrightarrow \begin{aligned}
& x_{1}=x_{3}+2 x_{4}+2 \\
& x_{2}=-2 x_{3}-3 x_{4}-2 \\
& x_{3}=x_{3} \\
& x_{4}=
\end{aligned}
$$

This gives the parametric vector form

$$
\left(\begin{array}{l}
x_{1} \\
x_{2} \\
x_{3} \\
x_{4}
\end{array}\right)=x_{3}\left(\begin{array}{c}
1 \\
-2 \\
1 \\
0
\end{array}\right)+x_{4}\left(\begin{array}{c}
2 \\
-3 \\
0 \\
1
\end{array}\right)+\left(\begin{array}{c}
2 \\
-2 \\
0 \\
0
\end{array}\right) .
$$

b) Part (a) shows that the solution set of the original equations is the translate of

$$
\operatorname{Span}\left\{\left(\begin{array}{c}
1 \\
-2 \\
1 \\
0
\end{array}\right),\left(\begin{array}{c}
2 \\
-3 \\
0 \\
1
\end{array}\right)\right\} \quad \text { by } \quad\left(\begin{array}{c}
2 \\
-2 \\
0 \\
0
\end{array}\right)
$$

We know that the solution set of the homogeneous equations is the parallel plane through the origin, so it is

$$
\operatorname{Span}\left\{\left(\begin{array}{c}
1 \\
-2 \\
1 \\
0
\end{array}\right),\left(\begin{array}{c}
2 \\
-3 \\
0 \\
1
\end{array}\right)\right\}
$$

Hence the parametric vector form is

$$
\left(\begin{array}{l}
x_{1} \\
x_{2} \\
x_{3} \\
x_{4}
\end{array}\right)=x_{3}\left(\begin{array}{c}
1 \\
-2 \\
1 \\
0
\end{array}\right)+x_{4}\left(\begin{array}{c}
2 \\
-3 \\
0 \\
1
\end{array}\right) .
$$

c) No. Recall that $\operatorname{Span}\{b, v, w\}$ is the set of all linear combinations of $b, v$, and $w$. If $b$ is in $\operatorname{Span}\{v, w\}$ then $b$ is a linear combination of $v$ and $w$. Consequently, any element of $\operatorname{Span}\{b, v, w\}$ is a linear combination of $v$ and $w$ and is therefore in $\operatorname{Span}\{v, w\}$, which is at most a 2-plane and cannot be all of $\mathbf{R}^{3}$.

To see why the span of $v$ and $w$ can never be $\mathbf{R}^{3}$, consider the matrix $A$ whose columns are $v$ and $w$. Since $A$ is $3 \times 2$, it has at most two pivots, so $A$ cannot have a pivot in every row. Therefore, by a theorem from section 1.4, the equation $A x=b$ will fail to be consistent for some $b$ in $\mathbf{R}^{3}$, which means that some $b$ in $\mathbf{R}^{3}$ is not in the span of $v$ and $w$.

The diagram below describes traffic in a part of town.

a) Write a system of three linear equations in $x_{1}, x_{2}$, and $x_{3}$ corresponding to the traffic flow.
b) Use an augmented matrix to solve this system of linear equations. Were we given enough information to know the exact values of $x_{1}, x_{2}$, and $x_{3}$ ?

## Solution.

a) For the top, bottom right, and bottom left nodes, the number of cars entering must match the number of cars exiting, so the system is:

$$
\begin{gathered}
x_{1}+40=x_{3}+110 \\
x_{1}+x_{2}=360 \\
x_{2}+x_{3}=290 .
\end{gathered}
$$

b) The system can be written

$$
\begin{gathered}
x_{1}-x_{3}=70 \\
x_{1}+x_{2}=360 \\
x_{2}+x_{3}=290 .
\end{gathered}
$$

We form an augmented matrix and perform row operations.

$$
\left(\begin{array}{rrr|r}
1 & 0 & -1 & 70 \\
1 & 1 & 0 & 360 \\
0 & 1 & 1 & 290
\end{array}\right) \xrightarrow{R_{2}=R_{2}-R_{1}}\left(\begin{array}{rrr|r}
1 & 0 & -1 & 70 \\
0 & 1 & 1 & 290 \\
0 & 1 & 1 & 290
\end{array}\right) \xrightarrow{R_{3}=R_{3}-R_{2}}\left(\begin{array}{rrr|r}
1 & 0 & -1 & 70 \\
0 & 1 & 1 & 290 \\
0 & 0 & 0 & 0
\end{array}\right) .
$$

Therefore, $x_{3}$ is a free variable, $x_{1}=x_{3}+70$, and $x_{2}=290-x_{3}$.
We cannot know the exact values of $x_{1}, x_{2}$, and $x_{3}$ with the information we have only been given. For example, we could have $x_{3}=0, x_{2}=290, x_{1}=70$. Or, we could have $x_{3}=100, x_{2}=190, x_{1}=170$, etc.
